

1. Questions

Read the following information carefully and answer the questions based on it.

The table chart given below shows the ratio of the number of laptops sold and the number of desktops unsold by a shop on four different days: Monday, Tuesday, Wednesday and Thursday. It also shows the difference between the number of laptops sold and unsold (sold – unsold) and the difference between the number of desktops sold and unsold (sold – unsold) by the shop on each day.

Days	The ratio of the number of laptops sold and desktops unsold	The difference between the number of laptops sold and unsold (sold – unsold)	The difference between the number of desktops sold and unsold (sold – unsold)
Monday	2:1	120	80
Tuesday	5:2	40	320
Wednesday	7:3	140	140
Thursday	10:1	200	50

Note:

- i). The total number of items manufactured = the number of laptops manufactured (sold + unsold) + the number of desktops manufactured (sold + unsold)
- ii). On each day, the number of laptops sold is more than the number of laptops unsold and the number of desktops sold is more than the number of desktops unsold.
- iii). The number of laptops unsold on Monday is 25% of the number of desktops sold on the same day.
- iv). The total number of items manufactured on Tuesday is 120 more than the previous day.
- v). The number of laptops unsold on Wednesday is 160 less than the number of desktops sold on the same day.
- vi). The total number of desktops manufactured on Thursday is 220 less than the previous day.

Find the average number of laptops manufactured by the shop on all four days together.

- a. 235
- b. 420
- c. 175
- d. 300
- e. 120

@QuizByMickey

2. Questions

If $\frac{1}{4}$ th of the total number of desktops sold on Tuesday are sold through offline mode, which is twice the number of desktops sold through offline mode on Wednesday, then find the ratio of the

number of desktops sold through online mode on Tuesday and Wednesday.

(Note: Desktops are sold through online and offline mode only)

- a. 21:13
- b. 41:30
- c. 54:37
- d. 27:20
- e. 14:11

3. Questions

If 60% of the total number of items manufactured(Laptops + desktops) on Thursday are local brands, out of which $\frac{3}{4}$ th are laptops, find the difference between the number of laptops and desktops manufactured which are global brands on Thursday. [Level: Moderate]

(Note: Laptops and desktops manufactured are local and global brands only)

- a. 48
- b. 62
- c. 34
- d. 76
- e. 80

4. Questions

[X]% of the total number of laptops manufactured on Tuesday remained unsold, and [Y]% of the total number of desktops manufactured on Monday remained unsold.

Determine the correct relation between [X] and [Y].

- a. $X > Y$
- b. $X < Y$
- c. $X \geq Y$
- d. $X \leq Y$
- e. $X = Y$

@QuizByMickey

5. Questions

If the total number of laptops manufactured on Friday is 20% more than the previous day and $\frac{1}{6}$ th of the total number of laptops manufactured on Friday remained unsold, then find the number of laptops sold on Friday.

- a. 240

- b. 300
- c. 180
- d. 120
- e. 270

6. Questions

Find the approximate value and determine what should come in place of the question mark?

$$69.99\% \text{ of } 240.01 + \sqrt{35.93} = ?^2 + 50.07\% \text{ of } 299.91 + 7.93$$

- a. 2
- b. 4
- c. 8
- d. 5
- e. 7

7. Questions

$$(23.88 * 6.04) + (36.11 \div 3.97) * (37.94 - 2.01) = ?$$

- a. 468
- b. 315
- c. 272
- d. 180
- e. 541

8. Questions

$$45.02\% \text{ of } 179.91 - 67.93 \div 17.01 + ? = 36.85 * 3.07$$

- a. 72
- b. 34
- c. 21
- d. 57
- e. 90

@QuizByMickey

9. Questions

$$\sqrt{?} = (34.92 + 21.08) + (12.11 * 1.98) - (175.87 \div 4.03)$$

- a. 1225

- b. 1444
- c. 1024
- d. 1156
- e. 1296

10. Questions

$$40.06 * 2.98 - 9.93 * 5.07 = ?\% \text{ of } 99.94$$

- a. 32
- b. 24
- c. 70
- d. 56
- e. 80

11. Questions

Read the following information carefully and answer the questions based on it.

A certain number of people purchased two different types of items i.e., a clock and a watch, from three different e-commerce platforms, namely Amazon, Flipkart, and Shopify.

Amazon: The number of people who purchased only clocks is 160 more than the number of people who purchased only watches. The ratio of the total number of people who purchased clocks and the total number of people who purchased watches is 7:3. The sum of the number of people who purchased only watches and the total number of people who purchased clocks is 320.

Flipkart: The total number of people who purchased watches is 8.33% more than the number of people who purchased only clocks. The average of the total number of people who purchased clocks and the total number of people who purchased watches is 150. The total number of people who purchased clocks is 90 more than the number of people who purchased only watches.

Shopify: The ratio of the total number of people who purchased clocks and the total number of people who purchased watches is 12:7. The number of people who purchased only watches is 80 less than the total number of people who purchased clocks. The total number of people who purchased watches is 20 less than the number of people who purchased only clocks.

Note:

- i). Each person purchased at least one item from each platform.
- ii). The total number of people who purchased items = the number of people who purchased only clocks + the number of people who purchased only watches + the number of people who purchased both clocks and watches
- iii). The total number of people who purchased clocks = the number of people who purchased only clocks + the number of people who purchased both clocks and watches

iv). The total number of people who purchased watches = the number of people who purchased only watches + the number of people who purchased both clocks and watches

Find the ratio of the number of people who purchased both clocks and watches from Amazon to the number of people who purchased only watches from Flipkart.

- a. 3:2
- b. 5:4
- c. 1:1
- d. 2:1
- e. 4:3

12. Questions

From Shopify, if the number of females who purchased only clocks is 30, which is 20% more than the number of males who purchased only watches from the same platform, then find the difference between the number of males who purchased only clocks and the number of females who purchased only watches from Shopify.

- a. 32
- b. 45
- c. 17
- d. 60
- e. 24

13. Questions

Find the total number of people who purchased only clocks from all three platforms together.

- a. 300
- b. 360
- c. 280
- d. 240
- e. 410

@QuizByMickey

14. Questions

From Amazon, the number of people who purchased only digital watches is 5 times the difference between the number of people who purchased only smart watches and only analogue watches. If the number of people who purchased only smart watches is 10, then find the number of people who purchased only digital watches from Amazon. (smart > analogue)

(Note: From Amazon; Digital, smart, and analogue watches are purchased only)

- a. 15
- b. 10
- c. 5
- d. 25
- e. 20

15. Questions

Which of the following is/are definitely true?

- I:** The total number of people who purchased items from Amazon is twice that of Flipkart.
- II:** The ratio of the number of people who purchased both clocks and watches from Flipkart and that from Shopify is 3:5, respectively.
- III:** The number of people who purchased only watches from Amazon and that from Shopify are equal.
- a. Only III
 - b. Both II and III
 - c. Both I and II
 - d. Only II
 - e. All I, II and III

16. Questions

The following question has three series as series I, series II and series III. Find the pattern of series I, series II and series III in each question and give answer accordingly.

Series I has one wrong term and series II starts with the correct term that will replace the wrong term of series I. Series III has one wrong and one missing term. Each series follows different patterns.

Series I: 13, 22, 10, 25, 5, 28

Series II: ____, 8, 18, 57, 232, __[A]__

Series III: __[A / 5]__, 208, 155, 78, -43, __[B]__

@QuizByMickey

If [C] is the correct term that will replace the wrong term of series III, then find the value of $[A + C - B]$ will be exactly divisible by which of the following numbers?

I: 3

II: 6

III: 9

- a. Only I
- b. Both I and II

- c. Only II
- d. Both I and III
- e. All I, II and III

17. Questions

Series I, II and III has one missing term as [P], [Q] and [R]. Each series follows same pattern.

Series I: 20, 10, 10, __[P]__, 30, 75

Series II: [P - 10], 2.50, 2.50, 3.75, __[Q]__, 18.75

Series III: [Q + 2.50], 5, 5, 7.50, 15, __[R]__

Which of the following is/are correct?

I: $[Q + R] = [3P]$

II: $[P - Q] = [R / 3]$

III: $[R + P] = [Q]$

- a. Both II and III follow
- b. Both I and II follow
- c. Only I follows
- d. Only III follows
- e. All I, II and III follows

18. Questions

Series I, II and III has one wrong term each. Each series follows same pattern.

Series I: 11, 15, 21, 28, 39, [X]

Series II: $[X - 21]$, 34, [Y], 42, 58, 70

Series III: $[Y / 10]$, 8, 14, 22, [Z], 39

The correct terms that will replace the wrong terms of series I, II and III are [A], [B] and [C] respectively.

@QuizByMickey

Find the correct relation.

- a. $A < X$
- b. $B = Y$
- c. $C > Z$
- d. both a) and c)
- e. both b) and c)

19. Questions

Each series follows different patterns.

Series I: 18, 36, 12, [N], (60 / 7), (660 / 7)

Series II: 8, 64, 216, 512, 1000, [M]

Series III: 13, 16, [O], 40, 61, 88

Which of the following variable from series I, II, and III is/are exactly divisible by 3.

- a. Only series II follows
- b. Both series I and III follow
- c. Only series I follows
- d. Both series I and II follow
- e. All series I, II, and III follow

20. Questions

Each series followsthesame pattern.

Series I: 10, 50, 5, [K²], 2.50, 12.50

Series II: __[10K]__, ____, ____, ____, ____, __[L]__

Series III: __[2L]__, ____, ____, ____, ____, __[?]

What should come in place of the question mark?

- a. 156.25
- b. 175
- c. 125
- d. 125.50
- e. 100.75

Explanations:

@QuizByMickey

1. Questions

Monday

The ratio of the number of laptops sold and desktops unsold = 2:1. Let it be 2a and a respectively.

So, the number of laptops unsold = (2a – 120)

And, the number of desktops sold = (a + 80)

Now,

$$(2a - 120) / (a + 80) = 25 / 100$$

$$(2a - 120) / (a + 80) = 1 / 4$$

$$8a - 480 = a + 80$$

$$7a = 560$$

$$a = 80$$

Therefore,

$$\text{The number of laptops sold} = 2a = (2 * 80) = 160$$

$$\text{The number of laptops unsold} = (160 - 120) = 40$$

$$\text{The total number of laptops manufactured} = (160 + 40) = 200$$

$$\text{The number of desktops unsold} = a = 80$$

$$\text{The number of desktops sold} = (80 + 80) = 160$$

$$\text{The total number of desktops manufactured} = (160 + 80) = 240$$

$$\text{The total number of items manufactured} = (200 + 240) = 440$$

Tuesday

The ratio of the number of laptops sold and desktops unsold = 5:2. Let it be 5b and 2b respectively.

$$\text{So, the number of laptops unsold} = (5b - 40)$$

$$\text{And, the number of desktops sold} = (2b + 320)$$

$$\text{Now, the total number of items manufactured} = (440 + 120) = 560$$

So,

$$5b + (5b - 40) + (2b + 320) + 2b = 560$$

$$14b = 280$$

$$b = 20$$

Therefore,

$$\text{The number of laptops sold} = 5b = (5 * 20) = 100$$

$$\text{The number of laptops unsold} = (100 - 40) = 60$$

$$\text{The total number of laptops manufactured} = (100 + 60) = 160$$

$$\text{The number of desktops unsold} = 2b = (2 * 20) = 40$$

$$\text{The number of desktops sold} = (40 + 320) = 360$$

$$\text{The total number of desktops manufactured} = (360 + 40) = 400$$

Wednesday

The ratio of the number of laptops sold and desktops unsold = 7:3. Let it be 7c and 3c respectively.

@QuizByMickey

So, the number of laptops unsold = $(7c - 140)$

And, the number of desktops sold = $(3c + 140)$

Now,

$$(3c + 140) - (7c - 140) = 160$$

$$280 - 4c = 160$$

$$4c = 120$$

$$c = 30$$

Therefore,

$$\text{The number of laptops sold} = 7c = (7 * 30) = 210$$

$$\text{The number of laptops unsold} = (210 - 140) = 70$$

$$\text{The total number of laptops manufactured} = (210 + 70) = 280$$

$$\text{The number of desktops unsold} = 3c = (3 * 30) = 90$$

$$\text{The number of desktops sold} = (90 + 140) = 230$$

$$\text{The total number of desktops manufactured} = (230 + 90) = 320$$

$$\text{The total number of items manufactured} = (280 + 320) = 600$$

Thursday

Let the number of desktops sold be d .

$$\text{So, the number of desktops unsold} = (d - 50)$$

$$\text{The total number of desktops manufactured} = d + (d - 50) = (2d - 50)$$

Now,

$$2d - 50 = 320 - 220$$

$$2d = 100 + 50$$

$$2d = 150$$

$$d = 75$$

$$\text{So, the number desktops sold} = d = 75$$

$$\text{The number of desktops unsold} = (75 - 50) = 25$$

$$\text{So, the total number of desktops manufactured} = (75 + 25) = 100$$

$$\text{The ratio of the number of laptops sold and desktops unsold} = 10:1$$

$$\text{Now, the number of laptops sold} = 25/1 * 10 = 250$$

$$\text{So, the number of laptops unsold} = (250 - 200) = 50$$

$$\text{The total number of laptops manufactured} = (250 + 50) = 300$$

@QuizByMickey

The total number of items manufactured = $(300 + 100) = 400$

Laptops

Days	The total number of laptops manufactured	The number of laptops sold	The number of laptops unsold
Monday	200	160	40
Tuesday	160	100	60
Wednesday	280	210	70
Thursday	300	250	50
Total	940	720	220

Desktops

Days	The total number of desktops manufactured	The number of desktops sold	The number of desktops unsold
Monday	240	160	80
Tuesday	400	360	40
Wednesday	320	230	90
Thursday	100	75	25
Total	1060	825	235

Answer: A

Now, according to the question,

The number of laptops manufactured by the shop on,

Monday = 200

Tuesday = 160

Wednesday = 280

Thursday = 300

Therefore, the required average = $(200 + 160 + 280 + 300) / 4 = (940 / 4) = 235$.

Hence, the correct answer is option A.

2. Questions

Monday

The ratio of the number of laptops sold and desktops unsold = 2:1. Let it be $2a$ and a respectively.

So, the number of laptops unsold = $(2a - 120)$

And, the number of desktops sold = $(a + 80)$

Now,

$$(2a - 120) / (a + 80) = 25 / 100$$

$$(2a - 120) / (a + 80) = 1 / 4$$

$$8a - 480 = a + 80$$

$$7a = 560$$

$$a = 80$$

Therefore,

$$\text{The number of laptops sold} = 2a = (2 * 80) = 160$$

$$\text{The number of laptops unsold} = (160 - 120) = 40$$

$$\text{The total number of laptops manufactured} = (160 + 40) = 200$$

$$\text{The number of desktops unsold} = a = 80$$

$$\text{The number of desktops sold} = (80 + 80) = 160$$

$$\text{The total number of desktops manufactured} = (160 + 80) = 240$$

$$\text{The total number of items manufactured} = (200 + 240) = 440$$

Tuesday

The ratio of the number of laptops sold and desktops unsold = 5:2. Let it be 5b and 2b respectively.

$$\text{So, the number of laptops unsold} = (5b - 40)$$

$$\text{And, the number of desktops sold} = (2b + 320)$$

$$\text{Now, the total number of items manufactured} = (440 + 120) = 560$$

So,

$$5b + (5b - 40) + (2b + 320) + 2b = 560$$

$$14b = 280$$

$$b = 20$$

Therefore,

$$\text{The number of laptops sold} = 5b = (5 * 20) = 100$$

$$\text{The number of laptops unsold} = (100 - 40) = 60$$

$$\text{The total number of laptops manufactured} = (100 + 60) = 160$$

$$\text{The number of desktops unsold} = 2b = (2 * 20) = 40$$

$$\text{The number of desktops sold} = (40 + 320) = 360$$

$$\text{The total number of desktops manufactured} = (360 + 40) = 400$$

Wednesday

The ratio of the number of laptops sold and desktops unsold = 7:3. Let it be 7c and 3c respectively.

@QuizByMickey

So, the number of laptops unsold = $(7c - 140)$

And, the number of desktops sold = $(3c + 140)$

Now,

$$(3c + 140) - (7c - 140) = 160$$

$$280 - 4c = 160$$

$$4c = 120$$

$$c = 30$$

Therefore,

$$\text{The number of laptops sold} = 7c = (7 * 30) = 210$$

$$\text{The number of laptops unsold} = (210 - 140) = 70$$

$$\text{The total number of laptops manufactured} = (210 + 70) = 280$$

$$\text{The number of desktops unsold} = 3c = (3 * 30) = 90$$

$$\text{The number of desktops sold} = (90 + 140) = 230$$

$$\text{The total number of desktops manufactured} = (230 + 90) = 320$$

$$\text{The total number of items manufactured} = (280 + 320) = 600$$

Thursday

Let the number of desktops sold be d .

$$\text{So, the number of desktops unsold} = (d - 50)$$

$$\text{The total number of desktops manufactured} = d + (d - 50) = (2d - 50)$$

Now,

$$2d - 50 = 320 - 220$$

$$2d = 100 + 50$$

$$2d = 150$$

$$d = 75$$

$$\text{So, the number desktops sold} = d = 75$$

$$\text{The number of desktops unsold} = (75 - 50) = 25$$

$$\text{So, the total number of desktops manufactured} = (75 + 25) = 100$$

$$\text{The ratio of the number of laptops sold and desktops unsold} = 10:1$$

$$\text{Now, the number of laptops sold} = 25/1 * 10 = 250$$

$$\text{So, the number of laptops unsold} = (250 - 200) = 50$$

$$\text{The total number of laptops manufactured} = (250 + 50) = 300$$

@QuizByMickey

The total number of items manufactured = $(300 + 100) = 400$

Laptops

Days	The total number of laptops manufactured	The number of laptops sold	The number of laptops unsold
Monday	200	160	40
Tuesday	160	100	60
Wednesday	280	210	70
Thursday	300	250	50
Total	940	720	220

Desktops

Days	The total number of desktops manufactured	The number of desktops sold	The number of desktops unsold
Monday	240	160	80
Tuesday	400	360	40
Wednesday	320	230	90
Thursday	100	75	25
Total	1060	825	235

Answer: C

Tuesday

The total number of desktops sold = 360

The number of desktops sold through offline mode = $1/4$ of 360 = 90

The number of desktops sold through online mode = $(360 - 90) = 270$

Wednesday

The total number of desktops sold = 230

The number of desktops sold through offline mode = $(90 / 2) = 45$ @QuizByMickey

The number of desktops sold through online mode = $(230 - 45) = 185$

Therefore, the required ratio = $270:185 = 54:37$.

Hence, the correct answer is option C.

3. Questions

Monday

The ratio of the number of laptops sold and desktops unsold = 2:1. Let it be $2a$ and a respectively.

So, the number of laptops unsold = $(2a - 120)$

And, the number of desktops sold = $(a + 80)$

Now,

$$(2a - 120) / (a + 80) = 25 / 100$$

$$(2a - 120) / (a + 80) = 1 / 4$$

$$8a - 480 = a + 80$$

$$7a = 560$$

$$a = 80$$

Therefore,

$$\text{The number of laptops sold} = 2a = (2 * 80) = 160$$

$$\text{The number of laptops unsold} = (160 - 120) = 40$$

$$\text{The total number of laptops manufactured} = (160 + 40) = 200$$

$$\text{The number of desktops unsold} = a = 80$$

$$\text{The number of desktops sold} = (80 + 80) = 160$$

$$\text{The total number of desktops manufactured} = (160 + 80) = 240$$

$$\text{The total number of items manufactured} = (200 + 240) = 440$$

Tuesday

The ratio of the number of laptops sold and desktops unsold = 5:2. Let it be $5b$ and $2b$ respectively.

$$\text{So, the number of laptops unsold} = (5b - 40)$$

$$\text{And, the number of desktops sold} = (2b + 320)$$

$$\text{Now, the total number of items manufactured} = (440 + 120) = 560$$

So,

$$5b + (5b - 40) + (2b + 320) + 2b = 560$$

$$14b = 280$$

$$b = 20$$

Therefore,

$$\text{The number of laptops sold} = 5b = (5 * 20) = 100$$

$$\text{The number of laptops unsold} = (100 - 40) = 60$$

$$\text{The total number of laptops manufactured} = (100 + 60) = 160$$

$$\text{The number of desktops unsold} = 2b = (2 * 20) = 40$$

$$\text{The number of desktops sold} = (40 + 320) = 360$$

$$\text{The total number of desktops manufactured} = (360 + 40) = 400$$

@QuizByMickey

Wednesday

The ratio of the number of laptops sold and desktops unsold = 7:3. Let it be $7c$ and $3c$ respectively.

So, the number of laptops unsold = $(7c - 140)$

And, the number of desktops sold = $(3c + 140)$

Now,

$$(3c + 140) - (7c - 140) = 160$$

$$280 - 4c = 160$$

$$4c = 120$$

$$c = 30$$

Therefore,

$$\text{The number of laptops sold} = 7c = (7 * 30) = 210$$

$$\text{The number of laptops unsold} = (210 - 140) = 70$$

$$\text{The total number of laptops manufactured} = (210 + 70) = 280$$

$$\text{The number of desktops unsold} = 3c = (3 * 30) = 90$$

$$\text{The number of desktops sold} = (90 + 140) = 230$$

$$\text{The total number of desktops manufactured} = (230 + 90) = 320$$

$$\text{The total number of items manufactured} = (280 + 320) = 600$$

Thursday

Let the number of desktops sold be d .

$$\text{So, the number of desktops unsold} = (d - 50)$$

$$\text{The total number of desktops manufactured} = d + (d - 50) = (2d - 50)$$

Now,

$$2d - 50 = 320 - 220$$

$$2d = 100 + 50$$

$$2d = 150$$

$$d = 75$$

$$\text{So, the number desktops sold} = d = 75$$

$$\text{The number of desktops unsold} = (75 - 50) = 25$$

$$\text{So, the total number of desktops manufactured} = (75 + 25) = 100$$

$$\text{The ratio of the number of laptops sold and desktops unsold} = 10:1$$

$$\text{Now, the number of laptops sold} = 25/1 * 10 = 250$$

@QuizByMickey

So, the number of laptops unsold = $(250 - 200) = 50$

The total number of laptops manufactured = $(250 + 50) = 300$

The total number of items manufactured = $(300 + 100) = 400$

Laptops

Days	The total number of laptops manufactured	The number of laptops sold	The number of laptops unsold
Monday	200	160	40
Tuesday	160	100	60
Wednesday	280	210	70
Thursday	300	250	50
Total	940	720	220

Desktops

Days	The total number of desktops manufactured	The number of desktops sold	The number of desktops unsold
Monday	240	160	80
Tuesday	400	360	40
Wednesday	320	230	90
Thursday	100	75	25
Total	1060	825	235

Answer: E

Thursday

The total number of items manufactured = 400

The total number of laptops manufactured = 300

The total number of desktops manufactured = 100

The total number of local brand items manufactured = 60% of 400 = 240

The number of local brands laptops manufactured = $\frac{3}{4}$ of 240 = 180

The number of local brands desktops manufactured = $(240 - 180) = 60$

The total number of global brand items manufactured = $(400 - 240) = 160$

The number of global brands laptops manufactured = $(300 - 180) = 120$

The number of global brands desktops manufactured = $(100 - 60) = 40$

Therefore, the required difference = $(120 - 40) = 80$.

Hence, the correct answer is option E.

4. Questions

Monday

The ratio of the number of laptops sold and desktops unsold = 2:1. Let it be $2a$ and a respectively.

So, the number of laptops unsold = $(2a - 120)$

And, the number of desktops sold = $(a + 80)$

Now,

$$(2a - 120) / (a + 80) = 25 / 100$$

$$(2a - 120) / (a + 80) = 1 / 4$$

$$8a - 480 = a + 80$$

$$7a = 560$$

$$a = 80$$

Therefore,

$$\text{The number of laptops sold} = 2a = (2 * 80) = 160$$

$$\text{The number of laptops unsold} = (160 - 120) = 40$$

$$\text{The total number of laptops manufactured} = (160 + 40) = 200$$

$$\text{The number of desktops unsold} = a = 80$$

$$\text{The number of desktops sold} = (80 + 80) = 160$$

$$\text{The total number of desktops manufactured} = (160 + 80) = 240$$

$$\text{The total number of items manufactured} = (200 + 240) = 440$$

Tuesday

The ratio of the number of laptops sold and desktops unsold = 5:2. Let it be $5b$ and $2b$ respectively.

So, the number of laptops unsold = $(5b - 40)$

And, the number of desktops sold = $(2b + 320)$

Now, the total number of items manufactured = $(440 + 120) = 560$

So,

$$5b + (5b - 40) + (2b + 320) + 2b = 560$$

$$14b = 280$$

$$b = 20$$

Therefore,

$$\text{The number of laptops sold} = 5b = (5 * 20) = 100$$

$$\text{The number of laptops unsold} = (100 - 40) = 60$$

@QuizByMickey

The total number of laptops manufactured = $(100 + 60) = 160$

The number of desktops unsold = $2b = (2 * 20) = 40$

The number of desktops sold = $(40 + 320) = 360$

The total number of desktops manufactured = $(360 + 40) = 400$

Wednesday

The ratio of the number of laptops sold and desktops unsold = 7:3. Let it be $7c$ and $3c$ respectively.

So, the number of laptops unsold = $(7c - 140)$

And, the number of desktops sold = $(3c + 140)$

Now,

$$(3c + 140) - (7c - 140) = 160$$

$$280 - 4c = 160$$

$$4c = 120$$

$$c = 30$$

Therefore,

The number of laptops sold = $7c = (7 * 30) = 210$

The number of laptops unsold = $(210 - 140) = 70$

The total number of laptops manufactured = $(210 + 70) = 280$

The number of desktops unsold = $3c = (3 * 30) = 90$

The number of desktops sold = $(90 + 140) = 230$

The total number of desktops manufactured = $(230 + 90) = 320$

The total number of items manufactured = $(280 + 320) = 600$

Thursday

Let the number of desktops sold be d .

So, the number of desktops unsold = $(d - 50)$

The total number of desktops manufactured = $d + (d - 50) = (2d - 50)$

Now,

$$2d - 50 = 320 - 220$$

$$2d = 100 + 50$$

$$2d = 150$$

$$d = 75$$

So, the number desktops sold = $d = 75$

@QuizByMickey

The number of desktops unsold = $(75 - 50) = 25$

So, the total number of desktops manufactured = $(75 + 25) = 100$

The ratio of the number of laptops sold and desktops unsold = 10:1

Now, the number of laptops sold = $25/1 \times 10 = 250$

So, the number of laptops unsold = $(250 - 200) = 50$

The total number of laptops manufactured = $(250 + 50) = 300$

The total number of items manufactured = $(300 + 100) = 400$

Laptops

Days	The total number of laptops manufactured	The number of laptops sold	The number of laptops unsold
Monday	200	160	40
Tuesday	160	100	60
Wednesday	280	210	70
Thursday	300	250	50
Total	940	720	220

Desktops

Days	The total number of desktops manufactured	The number of desktops sold	The number of desktops unsold
Monday	240	160	80
Tuesday	400	360	40
Wednesday	320	230	90
Thursday	100	75	25
Total	1060	825	235

Answer: A

The total number of laptops manufactured on Tuesday = 160

The number of laptops unsold on Tuesday = 60

So, $X = 60/160 \times 100 = 37.50\%$.

The total number of desktops manufactured on Monday = 240

The number of desktops unsold on Monday = 80

So, $Y = 80/240 \times 100 = 33.33\%$.

Therefore, $X > Y$.

Hence, the correct answer is option A.

@QuizByMickey

5. Questions

Monday

The ratio of the number of laptops sold and desktops unsold = 2:1. Let it be $2a$ and a respectively.

So, the number of laptops unsold = $(2a - 120)$

And, the number of desktops sold = $(a + 80)$

Now,

$$(2a - 120) / (a + 80) = 25 / 100$$

$$(2a - 120) / (a + 80) = 1 / 4$$

$$8a - 480 = a + 80$$

$$7a = 560$$

$$a = 80$$

Therefore,

The number of laptops sold = $2a = (2 * 80) = 160$

The number of laptops unsold = $(160 - 120) = 40$

The total number of laptops manufactured = $(160 + 40) = 200$

The number of desktops unsold = $a = 80$

The number of desktops sold = $(80 + 80) = 160$

The total number of desktops manufactured = $(160 + 80) = 240$

The total number of items manufactured = $(200 + 240) = 440$

Tuesday

The ratio of the number of laptops sold and desktops unsold = 5:2. Let it be $5b$ and $2b$ respectively.

So, the number of laptops unsold = $(5b - 40)$

And, the number of desktops sold = $(2b + 320)$

Now, the total number of items manufactured = $(440 + 120) = 560$

So,

$$5b + (5b - 40) + (2b + 320) + 2b = 560$$

$$14b = 280$$

$$b = 20$$

Therefore,

The number of laptops sold = $5b = (5 * 20) = 100$

The number of laptops unsold = $(100 - 40) = 60$

@QuizByMickey

The total number of laptops manufactured = $(100 + 60) = 160$

The number of desktops unsold = $2b = (2 * 20) = 40$

The number of desktops sold = $(40 + 320) = 360$

The total number of desktops manufactured = $(360 + 40) = 400$

Wednesday

The ratio of the number of laptops sold and desktops unsold = 7:3. Let it be $7c$ and $3c$ respectively.

So, the number of laptops unsold = $(7c - 140)$

And, the number of desktops sold = $(3c + 140)$

Now,

$$(3c + 140) - (7c - 140) = 160$$

$$280 - 4c = 160$$

$$4c = 120$$

$$c = 30$$

Therefore,

The number of laptops sold = $7c = (7 * 30) = 210$

The number of laptops unsold = $(210 - 140) = 70$

The total number of laptops manufactured = $(210 + 70) = 280$

The number of desktops unsold = $3c = (3 * 30) = 90$

The number of desktops sold = $(90 + 140) = 230$

The total number of desktops manufactured = $(230 + 90) = 320$

The total number of items manufactured = $(280 + 320) = 600$

Thursday

Let the number of desktops sold be d .

So, the number of desktops unsold = $(d - 50)$

The total number of desktops manufactured = $d + (d - 50) = (2d - 50)$

Now,

$$2d - 50 = 320 - 220$$

$$2d = 100 + 50$$

$$2d = 150$$

$$d = 75$$

So, the number desktops sold = $d = 75$

@QuizByMickey

The number of desktops unsold = $(75 - 50) = 25$

So, the total number of desktops manufactured = $(75 + 25) = 100$

The ratio of the number of laptops sold and desktops unsold = 10:1

Now, the number of laptops sold = $25/1 \times 10 = 250$

So, the number of laptops unsold = $(250 - 200) = 50$

The total number of laptops manufactured = $(250 + 50) = 300$

The total number of items manufactured = $(300 + 100) = 400$

Laptops

Days	The total number of laptops manufactured	The number of laptops sold	The number of laptops unsold
Monday	200	160	40
Tuesday	160	100	60
Wednesday	280	210	70
Thursday	300	250	50
Total	940	720	220

Desktops

Days	The total number of desktops manufactured	The number of desktops sold	The number of desktops unsold
Monday	240	160	80
Tuesday	400	360	40
Wednesday	320	230	90
Thursday	100	75	25
Total	1060	825	235

Answer: B

Friday

@QuizByMickey

The total number of laptops manufactured = 120% of 300 = 360

The number of laptops unsold = $1/6$ of 360 = 60

Therefore, the number of laptops sold on Friday = $(360 - 60) = 300$.

Hence, the correct answer is option B.

6. Questions

Answer: B

$$69.99\% \text{ of } 240.01 + \sqrt{35.93} = ?^2 + 50.07\% \text{ of } 299.91 + 7.93$$

$$70\% \text{ of } 240 + \sqrt{36} = ?^2 + 50\% \text{ of } 300 + 8$$

$$168 + 6 = ?^2 + 150 + 8$$

$$174 = ?^2 + 158$$

$$16 = ?^2$$

$$\sqrt{16} = ?$$

$$4 = ?$$

Hence, the correct answer is option B.

7. Questions

Answer: A

$$(23.88 * 6.04) + (36.11 \div 3.97) * (37.94 - 2.01) = ?$$

$$(24 * 6) + (36 \div 4) * (38 - 2) = ?$$

$$144 + 9 * 36 = ?$$

$$144 + 324 = ?$$

$$468 = ?$$

Hence, the correct answer is option A.

8. Questions

Answer: B

$$45.02\% \text{ of } 179.91 - 67.93 \div 17.01 + ? = 36.85 * 3.07$$

$$45\% \text{ of } 180 - 68 \div 17 + ? = 37 * 3$$

$$81 - 4 + ? = 111$$

$$? = 111 + 4 - 81$$

$$? = 115 - 81$$

$$? = 34$$

Hence, the correct answer is option B.

9. Questions

Answer: E

$$\sqrt{?} = (34.92 + 21.08) + (12.11 * 1.98) - (175.87 \div 4.03)$$

$$\sqrt{?} = (35 + 21) + (12 * 2) - (176 \div 4)$$

$$\sqrt{?} = 56 + 24 - 44$$

@QuizByMickey

$$\sqrt{?} = 80 - 44$$

$$\sqrt{?} = 36$$

$$? = 36^2$$

$$? = 1296$$

Hence, the correct answer is option E.

10. Questions

Answer: C

$$40.06 * 2.98 - 9.93 * 5.07 = ?\% \text{ of } 99.94$$

$$40 * 3 - 10 * 5 = ?\% \text{ of } 100$$

$$120 - 50 = ?\% \text{ of } 100$$

$$70 = ?\% \text{ of } 100$$

$$70 = ? \div 100 \text{ of } 100$$

$$70 = ?$$

Hence, the correct answer is option C.

11. Questions

Amazon

Let the number of people who purchased only watches be a.

So, the number of people who purchased only clocks = (a + 160)

Also, let the number of people who purchased both clocks and watches be b.

Now, the total number of people who purchased clocks = (a + 160 + b)

And, the total number of people who purchased watches = (a + b)

So,

$$(a + 160 + b) / (a + b) = 7 / 3$$

$$3a + 480 + 3b = 7a + 7b$$

$$4a + 4b = 480$$

$$a + b = 120 \dots \dots \dots (I)$$

Also,

$$a + (a + 160 + b) = 320$$

$$2a + b = 160 \dots \dots \dots (II)$$

By solving equation (I) and (II), we get,

$$2a + 2b = 240$$

@QuizByMickey

$$2a + b = 160$$

$$b = 80$$

Now, put the value of b in equation (I), we get,

$$a + b = 120$$

$$a + 80 = 120$$

$$a = 40$$

Therefore,

The number of people who purchased only clocks = $(a + 160) = (40 + 160) = 200$

The number of people who purchased only watches = $a = 40$

The number of people who purchased both clocks and watches = $b = 80$

So, the total number of people who purchased items = $(200 + 40 + 80) = 320$.

Flipkart

The ratio of the number of people who purchased only clocks and the total number of people who purchased watches = 12:13. Let it be $12c$ and $13c$ respectively. (**Note: $8.33\% = 1/12$**)

Also, let the number of people who purchased only watches be d .

So, the number of people who purchased both clocks and watches = $(13c - d)$

And, the total number of people who purchased clocks = $(12c + 13c - d) = (25c - d)$

Now,

$$(25c - d) + 13c = (150 * 2)$$

$$38c - d = 300 \dots \dots \dots \text{(III)}$$

Also,

$$(12c + 13c - d) - d = 90$$

$$25c - 2d = 90 \dots \dots \dots \text{(IV)}$$

By solving equations (III) and (IV), we get,

$$950c - 25d = 7500$$

@QuizByMickey

$$950c - 76d = 3420$$

$$51d = 4080$$

$$d = 80$$

Now, put the value of d in equation (III), we get,

$$38c - d = 300$$

$$38c - 80 = 300$$

$$38c = 380$$

$$c = 10$$

Therefore,

The number of people who purchased only clocks = $12c = (12 * 10) = 120$

The number of people who purchased only watches = $d = 80$

The number of people who purchased both clocks and watches = $(13c - d) = (13 * 10 - 80) = (130 - 80) = 50$

So, the total number of people who purchased items = $(120 + 80 + 50) = 250$.

Shopify

Let the total number of people who purchased clocks and the total number of people who purchased watches be $12m$ and $7m$ respectively.

Also, let the number of people who purchased both clocks and watches be n .

So, the number of people who purchased only clocks = $(12m - n)$ @QuizByMickey

And, the number of people who only watches = $(7m - n)$

Now,

$$12m - (7m - n) = 80$$

$$12m - 80 = 7m - n$$

$$5m = 80 - n$$

$$5m + n = 80 \dots\dots\dots(V)$$

Also,

$$(12m - n) - 7m = 20$$

$$12m - n - 20 = 7m$$

$$5m - n = 20 \dots\dots\dots(VI)$$

By solving equations (V) and (VI), we get,

$$2n = 60$$

$$n = 30$$

Now, put the value of n in equation (V), we get,

$$5m + n = 80$$

$$5m + 30 = 80$$

$$5m = 50$$

$$m = 10$$

Therefore,

The number of people who purchased only clocks = $(12m - n) = (12 * 10 - 30) = (120 - 30) = 90$

The number of people who only watches = $(7m - n) = (7 * 10 - 30) = (70 - 30) = 40$

The number of people who purchased both clocks and watches = $n = 30$

So, the total number of people who purchased items = $(90 + 40 + 30) = 160$.

Answer: C

Now, according to the question,

The number of people who purchased both clocks and watches from Amazon = 80

And the number of people who purchased only watches from Flipkart = 80.

Therefore, the required ratio = $80:80 = 1:1$.

Hence, the correct answer is option C.

12. Questions

Amazon

Let the number of people who purchased only watches be a.

So, the number of people who purchased only clocks = $(a + 160)$

Also, let the number of people who purchased both clocks and watches be b .

Now, the total number of people who purchased clocks = $(a + 160 + b)$

And, the total number of people who purchased watches = $(a + b)$

So,

$$(a + 160 + b) / (a + b) = 7 / 3$$

$$3a + 480 + 3b = 7a + 7b$$

$$4a + 4b = 480$$

$$a + b = 120 \dots\dots\dots(I)$$

Also,

$$a + (a + 160 + b) = 320$$

$$2a + b = 160 \dots\dots\dots(II)$$

By solving equation (I) and (II), we get,

$$2a + 2b = 240$$

$$2a + b = 160$$

$$b = 80$$

Now, put the value of b in equation (I), we get,

$$a + b = 120$$

$$a + 80 = 120$$

$$a = 40$$

Therefore,

The number of people who purchased only clocks = $(a + 160) = (40 + 160) = 200$

The number of people who purchased only watches = $a = 40$

The number of people who purchased both clocks and watches = $b = 80$

So, the total number of people who purchased items = $(200 + 40 + 80) = 320$.

Flipkart

The ratio of the number of people who purchased only clocks and the total number of people who purchased watches = 12:13. Let it be $12c$ and $13c$ respectively. (**Note: $8.33\% = 1/12$**)

Also, let the number of people who purchased only watches be d .

So, the number of people who purchased both clocks and watches = $(13c - d)$

And, the total number of people who purchased clocks = $(12c + 13c - d) = (25c - d)$

Now,

$$(25c - d) + 13c = (150 * 2)$$

$$38c - d = 300 \dots\dots\dots(III)$$

Also,

$$(12c + 13c - d) - d = 90$$

$$25c - 2d = 90 \dots\dots\dots(IV)$$

By solving equations (III) and (IV), we get,

$$950c - 25d = 7500$$

$$950c - 76d = 3420$$

$$51d = 4080$$

$$d = 80$$

Now, put the value of d in equation (III), we get,

$$38c - d = 300$$

$$38c - 80 = 300$$

$$38c = 380$$

$$c = 10$$

Therefore,

$$\text{The number of people who purchased only clocks} = 12c = (12 * 10) = 120$$

$$\text{The number of people who purchased only watches} = d = 80$$

@QuizByMickey

$$\text{The number of people who purchased both clocks and watches} = (13c - d) = (13 * 10 - 80) = (130 - 80) = 50$$

$$\text{So, the total number of people who purchased items} = (120 + 80 + 50) = 250.$$

Shopify

Let the total number of people who purchased clocks and the total number of people who purchased watches be $12m$ and $7m$ respectively.

Also, let the number of people who purchased both clocks and watches be n .

So, the number of people who purchased only clocks = $(12m - n)$

And, the number of people who only watches = $(7m - n)$

Now,

$$12m - (7m - n) = 80$$

$$12m - 80 = 7m - n$$

$$5m = 80 - n$$

$$5m + n = 80 \dots\dots\dots(V)$$

Also,

$$(12m - n) - 7m = 20$$

$$12m - n - 20 = 7m$$

$$5m - n = 20 \dots\dots\dots(VI)$$

By solving equations (V) and (VI), we get,

$$2n = 60$$

$$n = 30$$

Now, put the value of n in equation (V), we get,

$$5m + n = 80$$

$$5m + 30 = 80$$

$$5m = 50$$

$$m = 10$$

Therefore,

$$\text{The number of people who purchased only clocks} = (12m - n) = (12 * 10 - 30) = (120 - 30) = 90$$

@QuizByMickey

The number of people who only watches = $(7m - n) = (7 * 10 - 30) = (70 - 30) = 40$

The number of people who purchased both clocks and watches = $n = 30$

So, the total number of people who purchased items = $(90 + 40 + 30) = 160$.

Answer: B

Shopify

The total number of people who purchased only clocks = 90

The number of females who purchased only clocks = 30

The number of males who purchased only clocks = $(90 - 30) = 60$

The total number of people who purchased only watches = 40

The number of males who purchased only watches = $30/120 * 100 = 25$

The number of females who purchased only watches = $(40 - 25) = 15$

Therefore, the required difference = $(60 - 15) = 45$.

Hence, the correct answer is option B.

13. Questions

Amazon

Let the number of people who purchased only watches be a.

So, the number of people who purchased only clocks = $(a + 160)$

Also, let the number of people who purchased both clocks and watches be b.

Now, the total number of people who purchased clocks = $(a + 160 + b)$

And, the total number of people who purchased watches = $(a + b)$

So,

$$(a + 160 + b) / (a + b) = 7 / 3$$

$$3a + 480 + 3b = 7a + 7b$$

$$4a + 4b = 480$$

$$a + b = 120 \dots \dots \dots (I)$$

Also,

$$a + (a + 160 + b) = 320$$

$$2a + b = 160 \dots\dots\dots(II)$$

By solving equation (I) and (II), we get,

$$2a + 2b = 240$$

$$2a + b = 160$$

$$b = 80$$

Now, put the value of b in equation (I), we get,

$$a + b = 120$$

$$a + 80 = 120$$

$$a = 40$$

Therefore,

The number of people who purchased only clocks = $(a + 160) = (40 + 160) = 200$

The number of people who purchased only watches = $a = 40$

The number of people who purchased both clocks and watches = $b = 80$

So, the total number of people who purchased items = $(200 + 40 + 80) = 320$.

Flipkart

The ratio of the number of people who purchased only clocks and the total number of people who purchased watches = 12:13. Let it be $12c$ and $13c$ respectively. (**Note: $8.33\% = 1/12$**)

Also, let the number of people who purchased only watches be d .

So, the number of people who purchased both clocks and watches = $(13c - d)$

And, the total number of people who purchased clocks = $(12c + 13c - d) = (25c - d)$

Now,

$$(25c - d) + 13c = (150 * 2)$$

$$38c - d = 300 \dots\dots\dots(III)$$

Also,

$$(12c + 13c - d) - d = 90$$

$$25c - 2d = 90 \dots\dots\dots(IV)$$

By solving equations (III) and (IV), we get,

$$950c - 25d = 7500$$

$$950c - 76d = 3420$$

$$51d = 4080$$

$$d = 80$$

Now, put the value of d in equation (III), we get,

$$38c - d = 300$$

$$38c - 80 = 300$$

$$38c = 380$$

$$c = 10$$

Therefore,

The number of people who purchased only clocks = $12c = (12 * 10) = 120$

The number of people who purchased only watches = $d = 80$

The number of people who purchased both clocks and watches = $(13c - d) = (13 * 10 - 80) = (130 - 80) = 50$

So, the total number of people who purchased items = $(120 + 80 + 50) = 250$.

@QuizByMickey

Shopify

Let the total number of people who purchased clocks and the total number of people who purchased watches be $12m$ and $7m$ respectively.

Also, let the number of people who purchased both clocks and watches be n .

So, the number of people who purchased only clocks = $(12m - n)$

And, the number of people who only watches = $(7m - n)$

Now,

$$12m - (7m - n) = 80$$

$$12m - 80 = 7m - n$$

$$5m = 80 - n$$

$$5m + n = 80 \dots\dots\dots(V)$$

Also,

$$(12m - n) - 7m = 20$$

$$12m - n - 20 = 7m$$

$$5m - n = 20 \dots\dots\dots(VI)$$

By solving equations (V) and (VI), we get,

$$2n = 60$$

$$n = 30$$

Now, put the value of n in equation (V), we get,

$$5m + n = 80$$

$$5m + 30 = 80$$

$$5m = 50$$

$$m = 10$$

Therefore,

$$\text{The number of people who purchased only clocks} = (12m - n) = (12 * 10 - 30) = (120 - 30) = 90$$

$$\text{The number of people who only watches} = (7m - n) = (7 * 10 - 30) = (70 - 30) = 40$$

$$\text{The number of people who purchased both clocks and watches} = n = 30$$

$$\text{So, the total number of people who purchased items} = (90 + 40 + 30) = 160.$$

@QuizByMickey

Answer: E

The number of people who purchased only clocks from,

Amazon = 200

Flipkart = 120

Shopify = 90

Therefore, the required sum = $(200 + 120 + 90) = 410$.

Hence, the correct answer is option E.

14. Questions

Amazon

Let the number of people who purchased only watches be a .

So, the number of people who purchased only clocks = $(a + 160)$

Also, let the number of people who purchased both clocks and watches be b .

Now, the total number of people who purchased clocks = $(a + 160 + b)$

And, the total number of people who purchased watches = $(a + b)$

So,

$$(a + 160 + b) / (a + b) = 7 / 3$$

$$3a + 480 + 3b = 7a + 7b$$

$$4a + 4b = 480$$

$$a + b = 120 \dots \dots \dots (I)$$

Also,

$$a + (a + 160 + b) = 320$$

$$2a + b = 160 \dots \dots \dots (II)$$

By solving equation (I) and (II), we get,

$$2a + 2b = 240$$

$$2a + b = 160$$

$$b = 80$$

Now, put the value of b in equation (I), we get,

$$a + b = 120$$

$$a + 80 = 120$$

$$a = 40$$

Therefore,

The number of people who purchased only clocks = $(a + 160) = (40 + 160) = 200$

The number of people who purchased only watches = $a = 40$

The number of people who purchased both clocks and watches = $b = 80$

So, the total number of people who purchased items = $(200 + 40 + 80) = 320$.

@QuizByMickey

Flipkart

The ratio of the number of people who purchased only clocks and the total number of people who purchased watches = 12:13. Let it be $12c$ and $13c$ respectively. (**Note: $8.33\% = 1/12$**)

Also, let the number of people who purchased only watches be d .

So, the number of people who purchased both clocks and watches = $(13c - d)$

And, the total number of people who purchased clocks = $(12c + 13c - d) = (25c - d)$

Now,

$$(25c - d) + 13c = (150 * 2)$$

$$38c - d = 300 \dots \dots \dots \text{(III)}$$

Also,

$$(12c + 13c - d) - d = 90$$

$$25c - 2d = 90 \dots \dots \dots \text{(IV)}$$

By solving equations (III) and (IV), we get,

$$950c - 25d = 7500$$

$$950c - 76d = 3420$$

$$51d = 4080$$

$$d = 80$$

Now, put the value of d in equation (III), we get,

$$38c - d = 300$$

$$38c - 80 = 300$$

$$38c = 380$$

$$c = 10$$

Therefore,

The number of people who purchased only clocks = $12c = (12 * 10) = 120$

The number of people who purchased only watches = $d = 80$

@QuizByMickey

The number of people who purchased both clocks and watches = $(13c - d) = (13 * 10 - 80) = (130 - 80) = 50$

So, the total number of people who purchased items = $(120 + 80 + 50) = 250$.

Shopify

Let the total number of people who purchased clocks and the total number of people who purchased watches be $12m$ and $7m$ respectively.

Also, let the number of people who purchased both clocks and watches be n .

So, the number of people who purchased only clocks = $(12m - n)$

And, the number of people who only watches = $(7m - n)$

Now,

$$12m - (7m - n) = 80$$

$$12m - 80 = 7m - n$$

$$5m = 80 - n$$

$$5m + n = 80 \dots\dots\dots(V)$$

Also,

$$(12m - n) - 7m = 20$$

$$12m - n - 20 = 7m$$

$$5m - n = 20 \dots\dots\dots(VI)$$

By solving equations (V) and (VI), we get,

$$2n = 60$$

$$n = 30$$

Now, put the value of n in equation (V), we get,

$$5m + n = 80$$

$$5m + 30 = 80$$

$$5m = 50$$

$$m = 10$$

@QuizByMickey

Therefore,

The number of people who purchased only clocks = $(12m - n) = (12 * 10 - 30) = (120 - 30) = 90$

The number of people who only watches = $(7m - n) = (7 * 10 - 30) = (70 - 30) = 40$

The number of people who purchased both clocks and watches = $n = 30$

So, the total number of people who purchased items = $(90 + 40 + 30) = 160$.

Answer: D

Amazon

The total number of people who purchased only watches = 40

The number of people who purchased only smart watches = 10

Let the difference between the number of people who purchased only smart watches and only analogue watches be k .

So, the number of people who purchased only digital watches = $(k * 5) = 5k$

And, the number of people who purchased only analogue watches = $(10 - k)$

Now,

$$10 + 5k + (10 - k) = 40$$

$$4k = 20$$

$$k = 5$$

Therefore, the number of people who purchased only digital watches from Amazon = $5k = (5 * 5) = 25$.

Hence, the correct answer is option D.

@QuizByMickey

15. Questions

Amazon

Let the number of people who purchased only watches be a .

So, the number of people who purchased only clocks = $(a + 160)$

Also, let the number of people who purchased both clocks and watches be b .

Now, the total number of people who purchased clocks = $(a + 160 + b)$

And, the total number of people who purchased watches = $(a + b)$

So,

$$(a + 160 + b) / (a + b) = 7 / 3$$

$$3a + 480 + 3b = 7a + 7b$$

$$4a + 4b = 480$$

$$a + b = 120 \dots\dots\dots(I)$$

Also,

$$a + (a + 160 + b) = 320$$

$$2a + b = 160 \dots\dots\dots(II)$$

By solving equation (I) and (II), we get,

$$2a + 2b = 240$$

$$2a + b = 160$$

$$b = 80$$

Now, put the value of b in equation (I), we get,

$$a + b = 120$$

$$a + 80 = 120$$

$$a = 40$$

Therefore,

The number of people who purchased only clocks = $(a + 160) = (40 + 160) = 200$

The number of people who purchased only watches = $a = 40$

The number of people who purchased both clocks and watches = $b = 80$

So, the total number of people who purchased items = $(200 + 40 + 80) = 320$.

@QuizByMickey

Flipkart

The ratio of the number of people who purchased only clocks and the total number of people who purchased watches = 12:13. Let it be 12c and 13c respectively. (**Note: 8.33% = 1/12**)

Also, let the number of people who purchased only watches be d.

So, the number of people who purchased both clocks and watches = $(13c - d)$

And, the total number of people who purchased clocks = $(12c + 13c - d) = (25c - d)$

Now,

$$(25c - d) + 13c = (150 * 2)$$

$$38c - d = 300 \dots \dots \dots (III)$$

Also,

$$(12c + 13c - d) - d = 90$$

$$25c - 2d = 90 \dots \dots \dots (IV)$$

By solving equations (III) and (IV), we get,

$$950c - 25d = 7500$$

$$950c - 76d = 3420$$

$$51d = 4080$$

$$d = 80$$

Now, put the value of d in equation (III), we get,

$$38c - d = 300$$

$$38c - 80 = 300$$

$$38c = 380$$

$$c = 10$$

Therefore,

The number of people who purchased only clocks = $12c = (12 * 10) = 120$

The number of people who purchased only watches = $d = 80$

The number of people who purchased both clocks and watches = $(13c - d) = (13 * 10 - 80) = (130 - 80) = 50$

So, the total number of people who purchased items = $(120 + 80 + 50) = 250$.

@QuizByMickey

Shopify

Let the total number of people who purchased clocks and the total number of people who purchased watches be $12m$ and $7m$ respectively.

Also, let the number of people who purchased both clocks and watches be n .

So, the number of people who purchased only clocks = $(12m - n)$

And, the number of people who only watches = $(7m - n)$

Now,

$$12m - (7m - n) = 80$$

$$12m - 80 = 7m - n$$

$$5m = 80 - n$$

$$5m + n = 80 \dots\dots\dots(V)$$

Also,

$$(12m - n) - 7m = 20$$

$$12m - n - 20 = 7m$$

$$5m - n = 20 \dots\dots\dots(VI)$$

By solving equations (V) and (VI), we get,

$$2n = 60$$

$$n = 30$$

Now, put the value of n in equation (V), we get,

$$5m + n = 80$$

$$5m + 30 = 80$$

$$5m = 50$$

$$m = 10$$

Therefore,

$$\text{The number of people who purchased only clocks} = (12m - n) = (12 * 10 - 30) = (120 - 30) = 90$$

$$\text{The number of people who only watches} = (7m - n) = (7 * 10 - 30) = (70 - 30) = 40$$

$$\text{The number of people who purchased both clocks and watches} = n = 30$$

$$\text{So, the total number of people who purchased items} = (90 + 40 + 30) = 160.$$

Answer: A

I: The total number of people who purchased items from Amazon = 320

The total number of people who purchased items from Flipkart = 250

320 is not twice 250.

So, I is definitely not true.

II: The number of people who purchased both clocks and watches from Flipkart = 50

The number of people who purchased both clocks and watches from Shopify = 30

The required ratio = 5:3.

So, II is definitely not true.

III: The number of people who purchased only watches from Amazon = 40

The number of people who purchased only watches from Shopify = 40.

So, III is definitely true.

Therefore, only III is definitely true.

Hence, the correct answer is option A.

16. Questions

Answer: B

Series I: 13, 22, 10, 25, 5, 28

1st term = 13

2nd term = (13 + 9) = 22

3rd term = (22 - 12) = 10

4th term = (10 + 15) = 25

5th term = (25 - 18) = 7 (5 is wrong)

6th term = (7 + 21) = 28

So, the wrong term = 5

@QuizByMickey

And, the correct term = 7

Series II: ____, 8, 18, 57, 232, __[A]__

7, 8, 18, 57, 232, __[A]__

1st term = 7

2nd term = $(7 * 1 + 1) = (7 + 1) = 8$

3rd term = $(8 * 2 + 2) = (16 + 2) = 18$

4th term = $(18 * 3 + 3) = (54 + 3) = 57$

5th term = $(57 * 4 + 4) = (228 + 4) = 232$

6th term = $(232 * 5 + 5) = (1160 + 5) = 1165$ (A)

So, the missing term = A = 1165

Series III: __[A / 5]__, 208, 155, 78, -43, __[B]__

__[1165 / 5]__, 208, 159, 78, -43, __[B]__

1st term = 233

2nd term = $(233 - 5^2) = (233 - 25) = 208$

3rd term = $(208 - 7^2) = (208 - 49) = 159$

4th term = $(159 - 9^2) = (159 - 81) = 78$

5th term = $(78 - 11^2) = (78 - 121) = -43$

6th term = $(-43 - 13^2) = (-43 - 169) = -212$ (B)

So, the missing term = B = -212

The wrong term = 155

The correct term = C = 159

Now,

$(A + C - B) = 1165 + 159 - (-212) = (1165 + 159 + 212) = 1536$

I: $(1536/3) = 512$

So, I does satisfy.

II: $(1536/6) = 256$

So, II does satisfy.

III: $(1536/9) = 170.67$

@QuizByMickey

So, III does not satisfy.

Therefore, both I and II follow.

Hence, the correct answer is option B.

17. Questions

Answer: C

Series I: 20, 10, 10, __[P]__, 30, 75

$$1^{\text{st}} \text{ term} = 20$$

$$2^{\text{nd}} \text{ term} = (20 * 0.50) = 10$$

$$3^{\text{rd}} \text{ term} = (10 * 1) = 10$$

$$4^{\text{th}} \text{ term} = (10 * 1.50) = 15 \text{ (P)}$$

$$5^{\text{th}} \text{ term} = (15 * 2) = 30$$

$$6^{\text{th}} \text{ term} = (30 * 2.50) = 75$$

So, the missing term = P = 15

Series II: [P – 10], 2.50, 2.50, 3.75, __[Q]__, 18.75

$$[15 - 10], 2.50, 2.50, 3.75, \text{__[Q]__}, 18.75$$

$$5, 2.50, 2.50, 3.75, \text{__[Q]__}, 18.75$$

$$1^{\text{st}} \text{ term} = 5$$

$$2^{\text{nd}} \text{ term} = (5 * 0.50) = 2.50$$

$$3^{\text{rd}} \text{ term} = (2.50 * 1) = 2.50$$

$$4^{\text{th}} \text{ term} = (2.50 * 1.50) = 3.75$$

$$5^{\text{th}} \text{ term} = (3.75 * 2) = 7.50 \text{ (Q)}$$

$$6^{\text{th}} \text{ term} = (7.50 * 2.50) = 18.75$$

So, the missing term = Q = 7.50

Series III: [Q + 2.50], 5, 5, 7.50, 15, __[R]__

$$[7.50 + 2.50], 5, 5, 7.50, 15, \text{__[R]__}$$

$$10, 5, 5, 7.50, 15, \text{__[R]__}$$

$$1^{\text{st}} \text{ term} = 10$$

$$2^{\text{nd}} \text{ term} = (10 * 0.50) = 5$$

@QuizByMickey

$$3^{\text{rd}} \text{ term} = (5 * 1) = 5$$

$$4^{\text{th}} \text{ term} = (5 * 1.50) = 7.5$$

$$5^{\text{th}} \text{ term} = (7.50 * 2) = 15$$

$$6^{\text{th}} \text{ term} = (15 * 2.50) = 37.50 \text{ (R)}$$

So, the missing term = R = 37.50

$$\text{I: } (Q + R) = (7.50 + 37.50) = 45$$

$$3P = (3 * 15) = 45$$

So, I is correct.

$$\text{II: } (P - Q) = (15 - 7.50) = 7.50$$

$$(R / 3) = (37.50 / 3) = 12.50$$

So, II is not correct.

$$\text{III: } (R + P) = (37.50 + 15) = 52.50$$

$$Q = 7.50$$

So, III is not correct.

Therefore, only I follows.

Hence, the correct answer is option C.

18. Questions

Answer: D

Series I: 11, 15, 21, 28, 39, [X]

$$1^{\text{st}} \text{ term} = 11$$

$$2^{\text{nd}} \text{ term} = (11 + 4) = 15$$

$$3^{\text{rd}} \text{ term} = (15 + 6) = 21$$

$$4^{\text{th}} \text{ term} = (21 + 8) = 29 \text{ (28 is wrong)}$$

$$5^{\text{th}} \text{ term} = (29 + 10) = 39$$

$$6^{\text{th}} \text{ term} = (39 + 12) = 51 \text{ (X)}$$

$$\text{So, } X = 51$$

The wrong term = 28

The correct term = A = 29

$$A < X.$$

@QuizByMickey

Therefore, option a) does satisfy.

Series II: $[X - 21], 34, [Y], 42, 58, 70$

$[51 - 21], 34, [Y], 42, 58, 70$

30, 34, $[Y], 42, 57, 67$

1st term = 30

2nd term = $(30 + 4) = 34$

3rd term = $(34 + 6) = 40$ (Y)

4th term = $(40 + 8) = 48$ (42 is wrong)

5th term = $(48 + 10) = 58$

6th term = $(58 + 12) = 70$

So, $Y = 40$

The wrong term = 42

The correct term = $B = 48$

So, $B \neq Y$.

Therefore, option b) does not satisfy.

Series III: $[Y / 10], 8, 14, 22, [Z], 39$

$[40 / 10], 8, 14, 22, [Z], 39$

4, 8, 14, 22, $[Z], 39$

1st term = 4

2nd term = $(4 + 4) = 8$

3rd term = $(8 + 6) = 14$

4th term = $(14 + 8) = 22$

5th term = $(22 + 10) = 32$ (Z)

6th term = $(32 + 12) = 44$ (39 is wrong)

So, $Z = 32$

The wrong term = 39

The correct term = $C = 44$

Therefore. $C > Z$.

@QuizByMickey

So, option c) does satisfy.

Therefore, both a) and c) does follow.

Hence, the correct answer is option D.

19. Questions

Answer: D

Series I: 18, 36, 12, [N], (60 / 7), (660 / 7)

$$1^{\text{st}} \text{ term} = 18$$

$$2^{\text{nd}} \text{ term} = (18 * 2) = 36$$

$$3^{\text{rd}} \text{ term} = (36 / 3) = 12$$

$$4^{\text{th}} \text{ term} = (12 * 5) = 60 \text{ (N)}$$

$$5^{\text{th}} \text{ term} = (60 / 7)$$

$$6^{\text{th}} \text{ term} = (60 / 7) * 11 = (660 / 7)$$

$$\text{So, } N = 60$$

60 is exactly divisible by 3.

Therefore, series I is correct.

Series II: 8, 64, 216, 512, 1000, [N]

$$1^{\text{st}} \text{ term} = 2^3 = 8$$

$$2^{\text{nd}} \text{ term} = 4^3 = 64$$

$$3^{\text{rd}} \text{ term} = 6^3 = 216$$

$$4^{\text{th}} \text{ term} = 8^3 = 512$$

$$5^{\text{th}} \text{ term} = 10^3 = 1000$$

$$6^{\text{th}} \text{ term} = 12^3 = 1728 \text{ (M)}$$

$$\text{So, } M = 1728$$

1728 is exactly divisible by 3.

Therefore, series II is correct.

Series III: 13, 16, [N], 40, 61, 88

$$1^{\text{st}} \text{ term} = 13$$

$$2^{\text{nd}} \text{ term} = (13 + 3) = 16$$

@QuizByMickey

$$3^{\text{rd}} \text{ term} = (16 + 9) = 25 \text{ (O)}$$

$$4^{\text{th}} \text{ term} = (25 + 15) = 40$$

$$5^{\text{th}} \text{ term} = (40 + 21) = 61$$

$$6^{\text{th}} \text{ term} = (61 + 27) = 88$$

$$\text{So, } O = 25$$

25 is not exactly divisible by 3.

Therefore, series III is not correct.

So, both series I and II follow.

Hence, the correct answer is option D.

20. Questions

Answer: A

Series I: 10, 50, 5, $[K^2]$, 2.50, 12.50

$$1^{\text{st}} \text{ term} = 10$$

$$2^{\text{nd}} \text{ term} = (10 * 5) = 50$$

$$3^{\text{rd}} \text{ term} = (50/10) = 5$$

$$4^{\text{th}} \text{ term} = (5 * 5) = 25 (K^2)$$

$$5^{\text{th}} \text{ term} = (25/10) = 2.50$$

$$6^{\text{th}} \text{ term} = (2.50 * 5) = 12.50$$

$$\text{So, } K^2 = 25$$

$$K = \sqrt{25}$$

$$K = 5$$

Series II: $\frac{10}{K}$, $\frac{50}{K}$, $\frac{5}{K}$, $\frac{25}{K}$, $\frac{2.50}{K}$, $\frac{12.50}{K}$

$$\frac{10}{5} = 2, \frac{50}{5} = 10, \frac{5}{5} = 1, \frac{25}{5} = 5, \frac{2.50}{5} = 0.5, \frac{12.50}{5} = 2.5$$

$$50, \frac{50}{5} = 10, \frac{5}{5} = 1, \frac{25}{5} = 5, \frac{2.50}{5} = 0.5, \frac{12.50}{5} = 2.5$$

$$1^{\text{st}} \text{ term} = 50$$

$$2^{\text{nd}} \text{ term} = (50 * 5) = 250$$

$$3^{\text{rd}} \text{ term} = (250/10) = 25$$

@QuizByMickey

$$4^{\text{th}} \text{ term} = (25 * 5) = 125$$

$$5^{\text{th}} \text{ term} = (125/10) = 12.50$$

$$6^{\text{th}} \text{ term} = (12.50 * 5) = 62.50 \text{ (L)}$$

$$\text{So, } L = 62.50$$

Series III: __[2L]__, ____, ____, ____, ____, __[?]

__[2 * 62.50]__, ____, ____, ____, ____, __[?]

125, ____, ____, ____, ____, __[?]

$$1^{\text{st}} \text{ term} = 125$$

$$2^{\text{nd}} \text{ term} = (125 * 5) = 625$$

$$3^{\text{rd}} \text{ term} = (625/10) = 62.5$$

$$4^{\text{th}} \text{ term} = (62.5 * 5) = 312.5$$

$$5^{\text{th}} \text{ term} = (312.5/10) = 31.25$$

$$6^{\text{th}} \text{ term} = (31.25 * 5) = 156.25 \text{ (?)}$$

Therefore, ? = 156.25

Hence, the correct answer is option A.
